

DOSSIER DE CANDIDATURE CONCOURS DOCTORAL 2025

NOM : Dutel

PRENOM : Jordan

TYPE D'ALLOCATION DEMANDE : 1- UCBL1 ☒ 2-Dons et Legs CLB ☐* 3-Indifférencié ☐

AVEZ-VOUS POSTULE A D'AUTRES FINANCEMENTS ? FRM ☐ ITMO ☐

Autres (préciser) ☒

* La bourse Dons et Legs implique des présentations régulières devant les financeurs et une capacité à vulgariser son sujet pour parler au grand public.

Pour que le dossier soit étudié, il doit être transmis complet en un seul PDF lors du dépôt de candidature par l'étudiant sur ADUM via ce lien <https://adum.fr/candidature/>.

Outre cette fiche, le dossier de candidature doit être en anglais

Voici ce que le PDF doit contenir :

1. Cette Fiche remplie (nom, prénom type d'allocation) en première page du dossier

2. Le Curriculum Vitae de la candidate/du candidat

Dans lequel les critères académiques seront précisés et détaillés. Donnez toutes les informations en votre possession concernant le M1 et le M2, ou équivalent, (notes déjà connues, équivalence éventuelle, rang, etc.), ainsi que la licence/bachelor ou équivalence et le baccalauréat ou équivalence. Si passage en Session 2 faire apparaître obligatoirement (car pas de classement en session 1 si session 2). **Fournir tous les relevés de notes + le rang en votre possession.**

3. Le curriculum vitae de la directrice/du directeur de thèse

Avec la liste des publications les plus significatives sur les 5 dernières années de **l'équipe d'accueil**, avec la place des étudiantes/étudiants en gras et de la directrice/du directeur de thèse soulignés. **Seul.es les directeur.ices et co-directeur.ices avec HDR peuvent figurer dans le dossier.**

4. Le titre et une description du projet de la thèse (5 pages maximum figures, annexes et bibliographies comprises)

5. Le calendrier de réalisation du projet sur 3 ans (1/2 page)

6. Le type d'allocation et si candidature à d'autres financements (demandé en début de page)

7. Un résumé vulgarisé du projet d'une demi page.

Si le choix 2 ou le choix 3 a été sélectionné dans le type d'allocation, un résumé vulgarisé indiquant l'intérêt sociétal du sujet sera transmis aux financeurs. Si le choix 1 est sélectionné, il n'est pas demandé de fournir ce résumé.

Le dossier de notation est à pré-remplir et à renvoyer par mail à la gestionnaire de l'école doctorale, ne surtout pas l'ajouter au PDF : Juliette.MAHE-BOUGUENNEC@lyon.unicancer.fr

Aspiring bioinformatician with a strong background in molecular biology and immunology, seeking to deepen expertise in multi-omics, data integration, and translational cancer research. Motivated to contribute to high-impact scientific projects and pursue a PhD in systems biology or immuno-oncology.

SKILLS

Bioinformatics	Transcriptomics (bulk and spatial), Seurat, Harmony, Nextflow, R, Python, Multi-omics Integration
Data Science	Dimensionality Reduction, Clustering, Differential Expression, Feature Selection, Statistical Modeling
Technical Tools	Git, Anaconda, LaTeX, Shell scripting, High Performance Computing (HPC)
Languages	French (native), English (fluent), Spanish and Italian (notions)

EXPERIENCE

Master 2 Bioinformatics Intern – Spatial Transcriptomic Analysis
CRCL – Centre de Recherche en Cancérologie de Lyon

February 2025 — Present
Lyon, France

- Analyzed spatial transcriptomics data (10X Visium) from 15 triple-negative breast cancer (MpBC) patients.
- Integrated expert-annotated phenotypic cell types to characterize tumor heterogeneity.
- Developed and optimized normalization, feature selection, and batch effect correction pipelines (Seurat, Harmony).
- Identified spatially enriched markers and distinct transcriptional profiles among tumor subtypes.
- Contributed to ongoing research on rare breast cancer evolution and potential PhD project.

Master 1 Bioinformatics Intern – Multi-omics Analysis
CLB – Centre Léon Bérard

April 2024 — August 2024
Lyon, France

- Performed integrative analysis of genomic, transcriptomic, and proteomic data from the Profiler cancer cohort.
- Conducted differential expression and pathway enrichment to identify molecular signatures associated with clinical subtypes.
- Implemented reproducible pipelines in R and Nextflow for data preprocessing and normalization.
- Applied MOFA to identify latent factors capturing shared and specific sources of variation across omics layers.

Master 2 Immunology Research Intern – Immunopathology and Immuno-oncology
CRCL – Centre de Recherche en Cancérologie de Lyon

January 2023 — June 2023
Lyon, France

- Investigated the regulation of NF-κB signaling pathway in response to pro-inflammatory stimuli in human cell lines.
- Performed cell culture, Western blotting, immunofluorescence, and qRT-PCR to assess pathway activation and gene expression.
- Contributed to functional assays exploring the role of NF-κB in cellular stress and apoptosis.
- Analyzed experimental data to characterize molecular mechanisms of inflammation-related gene regulation.

Master 1 Molecular Biology Research Intern – RNA Delivery
CIRI – Centre International de Recherche en Infectiologie

April 2022 — July 2022
Lyon, France

- Developed and characterized a novel RNA delivery system based on the endogenous retroviral protein hPEG10.
- Engineered non-viral particles for mRNA delivery into primary human cells.
- Performed molecular biology techniques including RT-PCR, qPCR, enzymatic digestions, and Western blotting.
- Contributed to the production and analysis of pseudo-viral particles and maintained primary cell cultures.
- Collaborated within a research team and presented results through scientific communication.

EDUCATION

Spring School on AI & Machine Learning in Biology and Health, AI4BioMed, UCBL1

April 7-9, 2025

Bioinformatics Master’s Degree, Claude Bernard Lyon 1 University — (UCBL1)

September 2023 — Present

- Master 2: All courses in Session 1 completed (grades not yet available; no ranking).
- Master 1:
 - Session 1: Grade = 13.213/20, Rank: 12/22.
 - Session 2: Grade = 13.816/20 (no rank available).

(+33) 6 36 85 52 78

Jordan Dutel

Bioinformatics Engineer – Junior Level

Portfolio: github.com/jdutel42

linkedin.com/in/jordan-dutel

Molecular and Cellular Biology Master's Degree, *Claude Bernard Lyon 1 University — (UCBL1)*
(Specialization in Immunology, Immunopathology, & Immunotherapy)

September 2021 — July 2023

- Master 2:
 - Session 1: Grade = 13.225/20, Rank: 10/12.
- Master 1:
 - Session 1: Grade = 13.116/20, Rank: 46/75.

Genetics Bachelor's Degree, *Claude Bernard Lyon 1 University — (UCBL1)*

September 2018 — June 2021

Licence 3:

- Session 1: Grade = 11.763/20, Rank: 39/129.
- Session 2: Grade = 12.509/20, Rank: 6/76.

PACES (Première Année Commune aux Études de Santé), *Jean Monnet University*

September 2016 — June 2018

Level: "Reçus-collés"

Scientific Baccalauréat (Honors: 'Assez Bien'), *Lycée L'Astrée, France*

June 2016

Obj. : Attestation de notes pour **Jordan Dutel**

Madame, Monsieur,

Nous sommes enseignants-chercheurs à l'Université Claude Bernard Lyon 1 et responsables du [Master 2 Bioinformatique](#).

Par la présente, nous attestons des notes de Jordan Dutel au Master Bioinformatique de Lyon, extraites du logiciel de notes de l'UCBL (voir page suivante).

Toutes les notes ne sont pas encore disponibles, et ces notes n'ont pas encore été validées par le jury. Le procès-verbal définitif ne sera établi que dans quelques mois.

Si vous avez des questions, n'hésitez pas à nous contacter (de préférence par email).

Bien cordialement,

Sabine Peres, Fabien Duchateau

EDUCATION

- 2023 **HDR** (*Habilitation à Diriger des Recherches*), Université Claude Bernard Lyon 1.
- 2008-2011 **PhD** under the supervision of Prof. Franca Fraternali (Randall Division of Cell and Molecular Biophysics, King's College London, England).
"Computational Analysis of Transcription Factors Cooperation and Protein-Protein Interactions Structural Features". *CASE Award (EPSRC)* in collaboration with the Nestlé Research Centre (Dr James Holzwarth, Lausanne, Switzerland).
- 2007 **Master in Bioinformatics**
Sardegna Ricerche, Pula, Italy.
- 2001-2006 **Master in Information Technology**
EPITECH, Paris, France.

WORK EXPERIENCE

- 2018- **Chargé de Recherche (Permanent PI position)**
Inserm / Cancer Research Centre of Lyon, France.
Quantifying, modeling, predicting and controlling cancer evolution and diversity.
- 2016-2018 **Assistant Scientist**
Cancer Research Centre of Lyon / Centre Léon Bérard, Lyon, France.
Analysis of clonal evolution of tumours.
- 2014-2016 **Post-doctoral Research Assistant**
Evolution and Cancer, Dr Trevor Graham's lab, Barts Cancer Institute, Queen Mary University, London, UK.
Analysis of evolutionary processes and dynamics in tumours and pre-malignant conditions.
- 2011-2013 **Post-doctoral Research Assistant**
Translational Cancer Therapeutics, Prof. Charles Swanton's lab, Cancer Research UK, London, UK.
Analysis of intra-tumour heterogeneity and chromosomal instability.

Evolutionary determinants and trajectories of metaplastic breast carcinomas

Introduction

Triple-negative breast cancers (TNBCs) face a lack of therapeutic options and high mortality rates¹. **Metaplastic breast carcinomas (MpBCs) are a rare subtype of TNBCs, characterized by high cellular plasticity** and the presence of at least one transdifferentiated tumor compartment^{2,3} (**Figure 1**). These compartments can be of various non-epithelial types, whose presence is determined exclusively through histological analysis. In addition, the mechanisms underlying their emergence and phenotypic switch remain unexplained. Cellular plasticity, which allows for these dynamic phenotypic changes, may also contribute to therapeutic resistance through non-genetic mechanisms^{4,5}. Due to their rarity and complexity, the biology of MpBCs remains poorly understood, and patients are therefore still inadequately managed.

Figure 1 – Example of a mixed MpBC sample.

Within the same tumor, an area of invasive epithelial breast carcinoma is visible on the left (magnified in the green box), and an area of chondroid transdifferentiation is visible on the right (magnified in the red box).

The objectives of this project are to **better understand the emergence of transdifferentiated compartments in MpBCs and to provide molecular diagnostic options for these tumors**. I will focus on mixed-histology MpBCs, in which phenotypically distinct compartment pairs can be studied, using high-precision multi-omics technologies: spatial transcriptomics and single-cell RNA sequencing (scRNA-seq); exome and methylome sequencing after microdissection. This approach will help uncover the origin and genetic/non-genetic mechanisms underlying **four different types of transdifferentiation: spindle cell, squamous, chondroid, and osteoid**. Fifteen mixed MpBC samples have already been analyzed using Visium spatial transcriptomics, and 15 others are currently being processed. The availability of orthogonal scRNA-seq data will enable more precise identification of deregulated genes and signaling pathways in transdifferentiated MpBC cells—both in comparison to classical epithelial cancer cells and to normal mesenchymal cells they resemble histologically. This will lay the groundwork for identifying new molecular diagnostic and classification solutions, as well as therapeutic opportunities that will be validated by the team's collaborators.

To achieve its goals, the project is structured around three specific aims:

- 1) **Creation** of a single-cell and spatial resolution transcriptomic atlas dedicated to MpBC.
- 2) **Characterization** of the genetic and non-genetic determinants of transdifferentiation in MpBC.
- 3) **Identification** of subtype-specific expression markers and signaling pathways.

Creation of a Single-Cell and Spatial Transcriptomic Atlas for MpBC

My project will enable a comprehensive characterization of the cellular and molecular features underlying MpBC heterogeneity. Despite the existence of multiple transcriptomic datasets on inter- and intra-tumoral heterogeneity in breast cancers, none are specific to MpBC. As shown by our preliminary data, this limits the ability of existing datasets to accurately deconvolute spatial transcriptomics data. Due to a lack of appropriate reference data, algorithms incorrectly attribute RNA profiles from Visium “spots” annotated as spindle to fibroblasts (**Figure 2A-C**). Despite the existence of expression signatures to detect the epithelial-to-mesenchymal transition (EMT), we still lack dedicated data on transdifferentiated cells in these breast cancers. The goal is therefore to **create an atlas, i.e. a precise and appropriate reference dataset—for decoding tumor cell heterogeneity in MpBC**, using single-cell RNA sequencing (scRNA-seq) combined with spatial transcriptomics.

Figure 2 – Preliminary spatial transcriptomic data.

A) Pre-Visium microscopic image of a mixed MpBC sample with spindle cells.

B) Visium spots (~10 cells) annotated.

C) Deconvolution scores of the different cell types contributing to the global transcriptomic signal of epithelial and spindle tumor spots.

D) UMAP projection of annotated spots from 15 mixed MpBC samples. Although subtype-specific clusters can be observed, the separation is imperfect due to Visium spots potentially containing mixtures of cell types.

E) Putative subtype-specific expression markers identified from preliminary analyses of annotated Visium spots. Higher-resolution single-cell data may yield even more relevant biomarkers.

As in previous work by the team⁶ and in my preliminary analyses, Visium slides will be annotated individually using a hybrid approach, combining K-means clustering with manual annotation by a trained pathologist. The **snPATHO-seq** protocol⁷, jointly developed by the single-cell platform at the Centre Léon Bérard (CLB), will be implemented to obtain single-nuclei RNA sequencing (snRNA-seq) data—a scRNA-seq variant better suited to FFPE samples used here. This method allows both **cell type annotation and copy number alteration (CNA) profiling**, with precision similar to cell-based methods. We will use it to create a single-cell expression dataset covering all rare MpBC cell types. For each of

the 4 types of transdifferentiation studied, I will select the 5 best spatially profiled samples (n=20), based on Visium quality control metrics and the clarity of separation between compartments.

A limitation of snRNA-seq is the lack of cross-referenced datasets for accurate annotation, especially for the rare subtypes studied here. However, spatial transcriptomic data and pathologist annotations will help overcome this. Marker expression profiles from snRNA-seq clusters will be cross-examined against dimensionally-reduced projections of our spatial transcriptomics data (**Figure 2D-E**), to confirm their match with specific transdifferentiation states.

Characterization of the genetic and non-genetic determinants of transdifferentiation in MpBC

To better understand the evolutionary trajectories of the 20 selected mixed MpBC samples, the team and its collaborators (Dr. M. Ouzounova, CRCL) are microdissecting the samples using a laser capture microscope (Zeiss PALM MicroBeam, CLB research pathology platform). This will allow **precise identification of genetic features in both compartments of each sample (Figure 3)**.

Figure 3 – Laser capture microdissection.

Selection of epithelial (green) and mesenchymal (red) areas in a case of mixed MpBC. Cresyl violet staining. Microdissected fragments from the two compartments are collected into separate tubes, and 8–10 serial sections are microdissected for each sample. Replicates from the same compartment are then pooled per sample for compartment-specific DNA extraction.

Somatic genetic alterations—point mutations, CNAs, and indels—will be identified through whole-exome sequencing (Twist Biosciences 2.0 kit) at 200x coverage. The Mutect2 software⁸ will be used for point mutation and indel analyses. In the absence of a normal control (blood or healthy tissue), paired compartments will serve as each other's reference to identify compartment-specific mutations. A mutation will be considered specific if present (allele frequency >15%) in one compartment and entirely absent in the other. Mutations listed as “drivers” in the COSMIC database and with >15% allele frequency in both compartments will be considered clonal (present in the original cancer cell). PureCN⁹ will be used to identify compartment-specific CNAs, using a pool of normal samples already sequenced by the team as reference.

To explore potential non-genetic determinants of transdifferentiation, deconvolution analyses will be performed using RCTD¹⁰, combining the existing breast cancer atlas data¹¹ and our dedicated MpBC atlas. **Differences in tumor microenvironment (TME) composition will be evaluated** by comparing spot compositions for each (trans)differentiation type, using ANOVA. To investigate whether external factors drive transdifferentiation, we will specifically analyze the composition of inner and outer borders of spatially segregated clusters (>25 spots) associated with transdifferentiated cells. Finally, using ligand-receptor databases^{12–14} and the SpatialDM¹⁵ tool, we will focus on **identifying ligand-receptor pairs likely to indicate interactions** between non-cancerous cells and transdifferentiated cancer cells.

Identification of subtype-specific expression markers and signaling pathways

Despite the existence of transcriptomic signatures like the claudin-low subtype^{16,17}, associated with MpBC¹⁸, the team's previous work has shown that **molecular approaches for MpBC identification remain inadequate**. This is especially due to similarities between mesenchymal stroma and transdifferentiated cells⁶. Differential expression analyses will therefore be conducted to identify specific biomarkers for each compartment type, based on snRNA-seq data (rather than the less accurate Visium data). Normalization and integration will be performed using Seurat. Two different methods will be implemented and compared to identify compartment-specific markers: 1) Seurat's FindAllMarkers function, and 2) MAST¹⁹, which uses a Hurdle model to correct for fixed and random effects, thereby efficiently addressing batch and sample biases. This approach ensures that pathological annotations from our Visium data provide reliable orthogonal information for single-cell classification, which in turn enables **more precise biomarker identification**.

We will also seek to **identify key regulators** potentially driving differential expression in each MpBC subtype. Using the SCENIC tool²⁰, we will identify gene regulatory networks specific to transdifferentiation subtypes and the transcription factors responsible for the observed expression profiles. This should narrow down the list of candidate genes for in-depth study and overcome the challenge of identifying relevant but lowly expressed genes. Finally, we will combine differential expression analyses performed across similar subtypes and within individual mixed-histology tumors. This will ensure that the selected genes are representative of most or all samples within each subtype, rather than being statistically significant but only relevant to a subset of samples.

Impact, feasibility, and perspectives

MpBC is a rare subtype of breast cancer that is still poorly managed. By addressing this issue, my project will benefit both researchers and healthcare professionals working on MpBC, as well as the affected patients. I will create and share a transdifferentiation atlas of MpBC at single-cell resolution with paired spatial resolution. This will **fill a significant knowledge gap** and serve as a valuable resource for future research.

My PhD project is part of a **national initiative** involving the Cancer Research Center of Lyon and the Centre Léon Bérard (Lyon), the Institut Curie (Paris), the Bergonié Institute (Bordeaux), and the Cancer Research and Immunology Center (Nantes). This initiative aims to improve the management of patients with metastatic breast cancer and to develop PDX and organoid models for studying transdifferentiation in aggressive breast cancer forms. This national effort is **supported by Ruban Rose, Ligue Régionale Contre le Cancer, and InterSIRIC funding**, which has enabled the administrative and logistical setup (legal agreements and material transfer between institutions), as well as the production of the multi-omics data I will analyze.

Finally, this national collaboration will enable the clinical and functional validation of the biomarkers I will identify. In collaboration with Institut Curie (Dr. V. Cockenpot), the specificity of biomarkers for each transdifferentiation type will be **validated by immunohistochemistry on an independent cohort**. This will assess their relevance for diagnostic and classification purposes in molecular analyses. Lastly, thanks to the InterSIRIC partnership, the functional impact of these markers will be studied through **genetic and pharmacological perturbations in two patient-derived MpBC models**: mouse xenografts (Dr. E. Marangoni, Institut Curie) and organoids (Dr. V. Guen, Cancer Research and Immunology Center of Nantes).

6) Type of allocation and application for other funding

This application is for a UCBL grant.

An application will also be submitted for a doctoral grant from the « Ligue Nationale Contre le Cancer » (submission deadline: June 24, 2025).
